5 october 2018

1. What you did ?

I had to implement my own terminal. To implement that terminal I had to parse input from an user and split all the commands in an array. I also had to implement the linux command CD and PWD to change directory and check the current directory name. I had to create process by forking the parent process and then create child processes.

2. What you have learned through the assignment ?

Through the assignment I learned how to manage the pointers more effectively as well as using new library for process creation and linux command.

3. Feedback :

Nothing to say.
